

Portfolio - Components

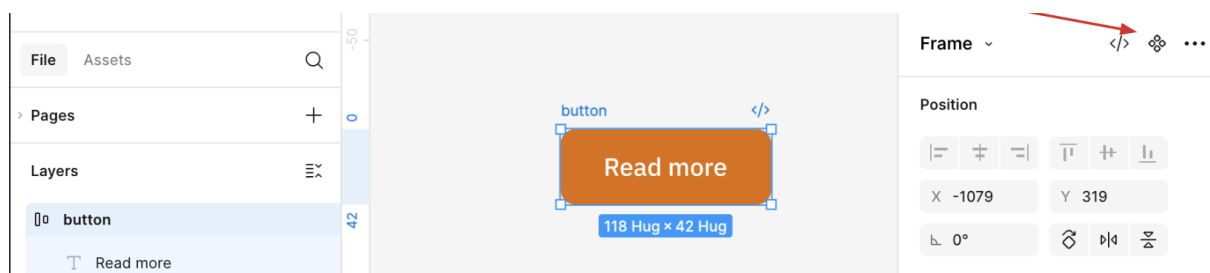

Learning Objectives

By the end of this session, you will be able to:

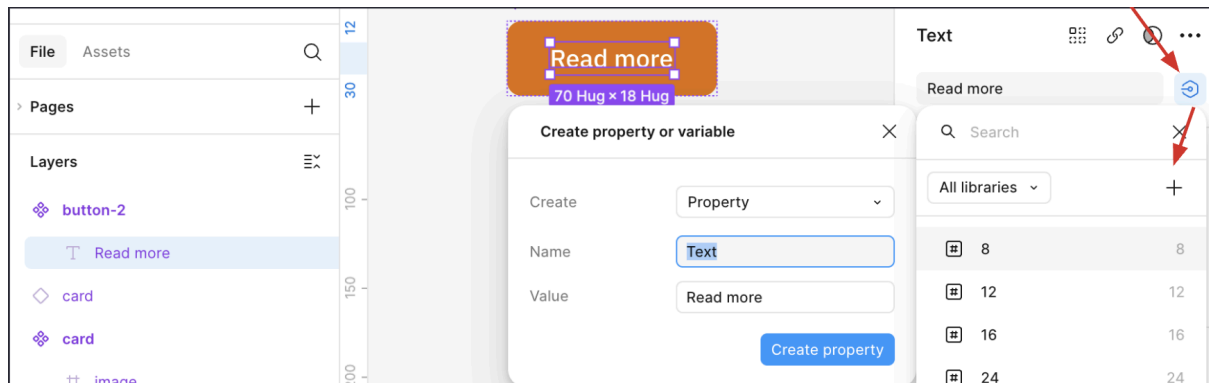

1. Create a button component with variants
2. Create a *header / navigation bar* component with logo and menu items
3. Apply auto-layout to created components
4. Use an icon plugin

Build a button component (15 mins)

- Open your *Styleguide* Figma page
- Create a *button* component
 - Create a text object, type *Read more*, select text object and *Shift + A* for auto layout.
 - Add a fill color to the auto layout group and apply spacing variables
 - Rename the auto layout layer to *button*
 - Select the *button* auto layout layer > *Create component*
 - macOS: *Option + Command + K*
 - Windows: *Ctrl + Alt + K*

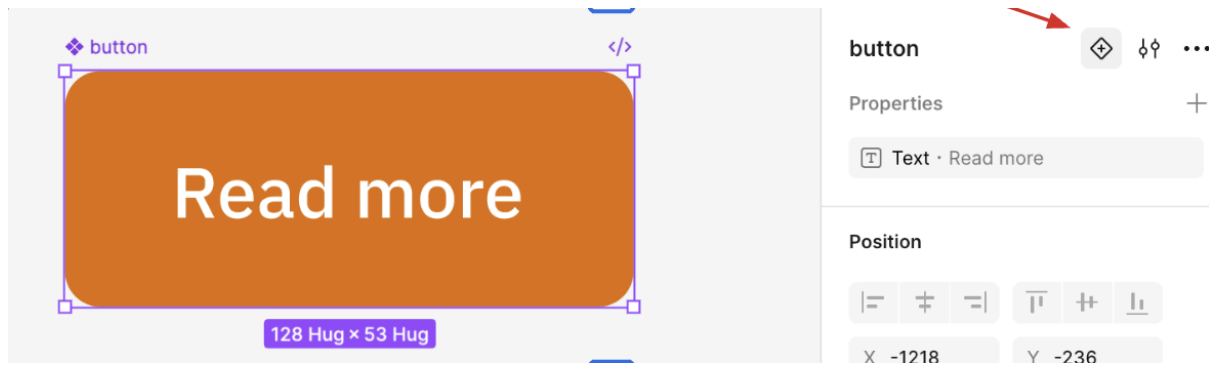

- Convert the text layer (*Read more*) to a Property text

Add variants to your button (15 mins)

- Select the *button* layer (the component) > Click *add variant*

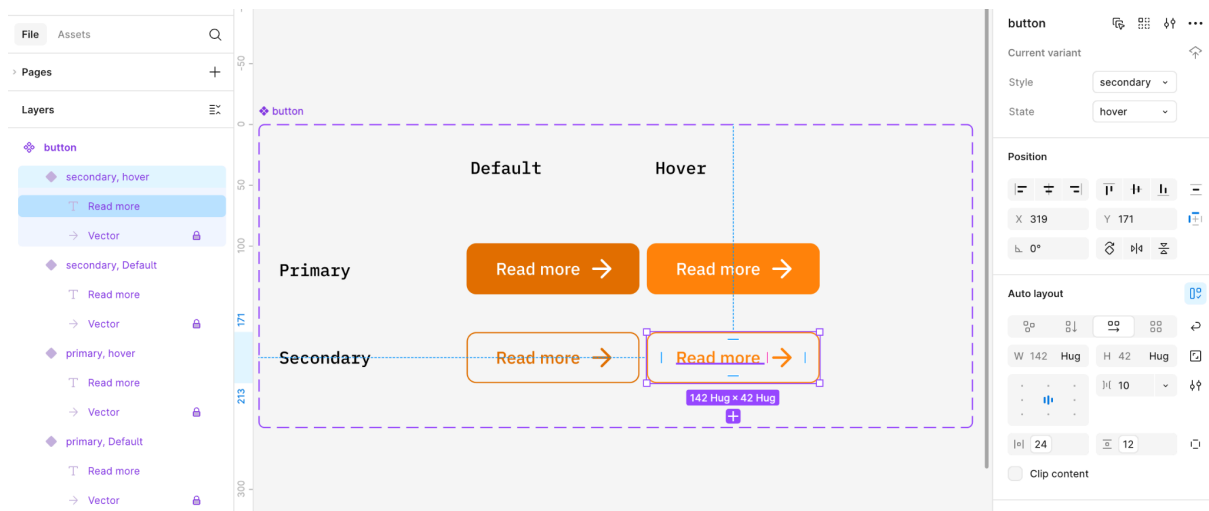

- Rename *Property1* to *Style*
- Rename *Default* to *primary*

- Double-click on the newly created button variant layer > Rename to "Style=secondary"
- Use a stroke color instead of a fill color, change text color
- Add another variant *State* (default, hover)
 - Click on the top *button* layer again > *Add variant*

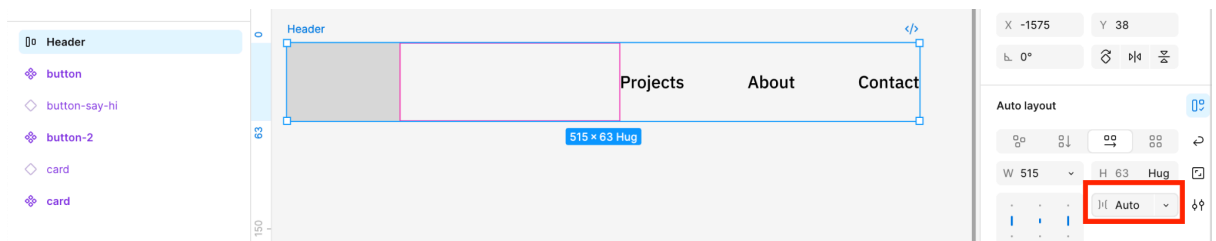

- Rename to *State=default*
- Duplicate your secondary button and rename the layer to *Style=primary, State=hover*
- Make sure you have 4 buttons in the end and the 2 hover buttons are using different color shades

- You can now insert a button *instance* with *Shift + I* > Search for *button*.
- Select *Style* and *State*, override *Text* value in the instance

Build a *header* component (20 mins)

- Create 3 text frames: *Projects, About, Contact*
- Put them in a horizontal auto layout
 - Select all three > *Shift + A*
 - apply a spacing variable for horizontal spacing
 - Set the width of all three text layers to *Hug*
- Create a rectangle as a logo placeholder
- Select the rectangle and the auto layout group of navi items > Apply auto layout with *Shift + A*
- Set *Horizontal gap between items* to *Auto*

- Rename the auto layout layer to *Header* and *Create component*
- Use the instances of the component on your desktop pages

Use a icon plugin (15 mins)

- Figma > Plugins > Manage plugins ...
- Search for *Lucide* or *Material Icons* > Run
- Figma > Plugins > *Lucide* opens the icon toolbar
- Insert an icon into one of your components

Build an image-based *hero* component

- Create 1-2 text layers with a catchy statement to introduce yourself
- Create a rectangle spanning your whole grid width
- Drag an image into Figma
- Place the image layer above the rectangle layer
- Select both > Right click > Use as mask
- Group all layers (CMD + G)
- Create component (OPTION + CMD + K)

Homework: Components - no hand in this time!

Goal: Create a button component with variants, header and footer components. Use them on your pages.

1. Create a *button* component
 - with a *text* property
 - with a variant *Style* with two values (primary and secondary)
 - with a variant *State* with two values (default and hover)
 - Resulting in a total of 4 button component variants
2. Create a *header desktop* component
3. Create a *header mobile* component
4. Create a *footer desktop* component
5. Create a *footer mobile* component
6. Use instances of those components on your home and project detail page (desktop & mobile)
7. Create a *hero* component which also uses an image and use it on your home page (desktop & mobile)
8. Depending on your design also **make sure other recurring parts are components** and not just copied over and over again on your pages.
9. Select File > Save a local copy > Upload the .fig file in e-learning
